

PITCH PERFECT

Tutorial v1.0
PitchPerfect Motion Sensor v1.0

CONNECT SENSORS

Go to Settings
&
Click 'Connect shirt'

Select your sensor
&
Click 'connect'

The sensor will now
connect to your
mobile device

Repeat step 1-3 for
'shorts'.

After the second
sensor is connected
the sensor will
synchronise. This
can take up to 20
seconds.

The app tells you
that you have
successfully
completed
connecting both
sensors.

Click 'ok' or tap
on the screen to
continue.

You can now check
your battery status,
sensor version
and your sensor
ID, which should
correspond to the
ID printed on the
back of the sensor.

START TRACKING

When the sensors are connected three dials appear on your start page. The dials provide the raw and unfiltered signal straight from the sensors.

Note that these values are not proper feedback on your pitching mechanics but solely a feature to see your sensors in action.

Press 'start' or the 'home plate' at the bottom of your screen to go to the tracking mode. Once you press the 'play' button all your pitching will be recorded.

Note that the sensors do not need to be connected when you start the tracking mode or during your training.

If your sensors are connected you will receive a pop-up and an audial cue after each successful pitch.

For a pitch to qualify as successful your mechanics need to be within the average range of normal pitch mechanics. For more insights you can check each individual pitch on the platform.

STOP TRACKING

Click the 'stop' button.

A pop-up will appear and guide you through the data storage process.

Do not turn your sensors off before you complete this process; the data of your on-going session will be lost.

To save session data the sensors need to be connected to your device.

If a sensor appears disconnected it will reconnect automatically when it is close to your mobile device.

If necessary, go to the settings menu and reconnect.

Once both sensors are connected you can click save. It will merge data from both sensors and save the report in the cloud.

The app tells you the data is successfully stored.

Click 'ok' or tap on the screen to continue.

You can now access your data at the stats page or at the platform online.

TROUBLESHOOTING

Can not find sensor.

1. Make sure the sensor is on.
2. Make sure the bluetooth on your phone is on.
3. Make sure your sensor is within range (<5m) of your device.
4. Make sure the 'PitchPerfect Baseball' App is allowed to access the bluetooth protocol of your device.
5. Make sure to update the 'PitchPerfect Baseball' App to its latest version.

If problems continue to exist:

6. Make sure you are in an environment without strong radio signals that can interfere with the bluetooth of your mobile device.
7. Refresh the search screen. To do so click 'cancel' and reopen the screen. Then click 'Connect shirt' or 'Connect shorts' again.
8. Restart the app.
9. Turn the sensors off and on again. Note that this will erase data that you captured in 'Tracking Mode'.

If you can't solve the problem
